

Abstract: Presentation on Australia's National hydrogen Strategy

This presentation provides an overview of the activities underway through Australia's National Hydrogen Strategy to realise Australia's vision to build a hydrogen and ammonia export industry. Australia has a pipeline of over 90 clean hydrogen projects spanning the hydrogen supply chain, including gigawatt scale electrolyser projects. The presentation covers the key policies and measures for building hydrogen and ammonia supply chains, which include international engagement and international partnerships on hydrogen, progress on research, development and demonstration activities, the development of a guarantee of origin scheme and other domestic initiatives.
